Design an app

The general idea of the app is an eat healthy app when you do not know what to eat. If you are in a rush to make dinner/breakfast/lunch and you don't know what to make, all you need to do is go onto the app and type in key words, for example chicken or spinach, it will then come up with recipes that contain the keywords you searched.

The app makes it easier for you to decide what you want to eat for breakfast/lunch/dinner.

The app is aimed at all ages or whoever feels like using it.

The USP of the app is that all you need to do to find the meal you want to eat is to type in what ingredients you feel like eating. For example, if you feel like eating a meal that contains tomatoes and celery the app will generate all the meal recipes on the app that contain tomatoes and celery. As well as all meals are suited for healthy eating.

This app may be similar to other meal planner apps but my app lets you search the ingredients you would like to eat instead of searching the meal you want to eat. ON the app you will also be able to upload a photo or video of a recipe you tried on the app.

It will be compatible with both IOS and Android.

The app will be free to download but there will only be limited meals and recipes to see for free. If you want access to all the meals and recipes on the app you need to upgrade to premium which you have to pay for.

The hardware/services that the app will use the camera, speaker and images so people can upload a picture or video of a recipe they tried on the app.

Sketches of the app:
